

Downloading and installing Ports using the Web interface

The following steps describe how to download Ports from the Support Zone and incorporate them into your SYSPRO installation.

- Ensure that an `upgrade` folder exists in the `base` folder of your SYSPRO installation. If this folder does not exist, then you must create it.

1. Open the **Downloads** page on the SYSPRO Support Zone.

- a. From the *Simplify* section of the Support Zone home page, select *Downloads [Web] 6.1*.

The **Downloads** page is displayed.

2. Download the required Port.

- a. From the *Port* list, select the port that you want to save.
- b. Select the *Download* option.
- c. Save the file to the `../SYSPRO61/base/upgrade` folder of your SYSPRO installation.

The required Port is now saved and ready to be installed.

3. Install the saved Port.

- a. Ensure that nobody is currently logged into SYSPRO.
- b. Log in to SYSPRO as an administrator.

You will be prompted to run the automatic upgrade process.

- c. Review any notes that are displayed and then select *Start Upgrade*.

If you are instructed to manually copy certain files, then ensure that you first exit from SYSPRO before copying them.

If you are required to copy a file manually to a client workstation, then you must perform this on each client workstation.

- d. When prompted, log out of SYSPRO to complete the installation of the Port.

The software is now ready for use and the operators can log in.
